Safety Information

For your own safety and the safety of others, and to prevent damage to the device and vehicles upon which it is used, it is important that the safety instructions presented throughout this manual be read and understood by all persons operating or coming into contact with the device.

There are numerous procedures, techniques, tools, and parts required for servicing vehicles, as well as the skills of the person doing the work. Because of the vast number of test applications and variations in the products that can be tested with this equipment, we cannot possibly anticipate or provide advice or safety messages to cover every circumstance. It is the automotive technician's responsibility to be knowledgeable of the system being tested. It is crucial to use proper service methods and test procedures. It is essential to perform tests in an appropriate and acceptable manner that does not endanger your safety, the safety of others in the work area, the device being used, or the vehicle being tested.

Before using the device, always refer to and follow the safety messages and applicable test procedures provided by the manufacturer of the vehicle or equipment being tested. Use the device only as described in this manual. Be sure to read, understand, and follow all safety messages and instructions in this manual.

Safety Messages

Safety messages are provided to help prevent personal injury and equipment damage. All safety messages are introduced by a signal word indicating the hazard level.

⚡ DANGER
Indicates an imminently hazardous situation which, if not avoided, could result in death or serious injury to the operator or to bystanders.

⚠ WARNING
Indicates a potentially hazardous situation which, if not avoided, could result in death or serious injury to the operator or to bystanders.

Safety Instructions

The safety messages herein cover situations Autel is aware of at the time of publication. Autel cannot know, evaluate or advise you as to all of the possible hazards. You must be certain that any condition or service procedure encountered does not jeopardize your personal safety.

⚠ DANGER

When an engine is operating, keep the service area WELL VENTILATED or attach a building exhaust removal system to the engine exhaust system. Engines produce carbon monoxide, an odorless, poisonous gas that causes slower reaction time and can lead to serious personal injury or loss of life.

⚠ It is not advised to use headphones at a high volume

Listening at high volumes for long periods of time may result in loss of hearing.

⚠ Safety Warnings

- Always perform automotive testing in a safe environment.
- Wear safety eye protection that meets ANSI standards.
- Keep clothing, hair, hands, tools, test equipment, etc. away from all moving or hot engine parts.
- Operate the vehicle in a well-ventilated work area, for exhaust gases are poisonous.
- Put the transmission in PARK (for automatic transmission) or NEUTRAL (for manual transmission) and make sure the parking brake is engaged.
- Put blocks in front of the drive wheels and never leave the vehicle unattended while testing.
- Be extra cautious when working around the ignition coil, distributor cap, ignition wires and spark plugs. These components create hazardous voltages when the engine is running.
- Keep a fire extinguisher suitable for gasoline, chemical, and electrical fires nearby.
- Do not connect or disconnect any test equipment while the ignition is on or the engine is running.
- Keep the test equipment dry, clean, free from oil, water or grease. Use a mild detergent on a clean cloth to clean the outside of the equipment as necessary.
- Do not drive the vehicle and operate the test equipment at the same time. Any distraction may cause an accident.
- Refer to the service manual for the vehicle being serviced and adhere to all diagnostic procedures and precautions. Failure to do so may result in personal injury or damage to the test equipment.
- To avoid damaging the test equipment or generating false data, make sure the vehicle battery is fully charged and the connection to the vehicle DLC is clean and secure.
- Do not place the test equipment on the distributor of the vehicle. Strong electro-magnetic interference can damage the equipment.

6 Diagnostics

The Diagnostics application can access the electronic control module of multiple vehicle control systems, including but not limited to the engine, transmission, antilock brake system (ABS), and airbag system (SRS).

6.1 Establish Vehicle Communication

The Diagnostics operations require connecting the MaxiSys tablet to the test vehicle through the VCMI2 using the main cable. (Use the applicable OBD I-type adapter if needed.) To establish proper vehicle communication with the tablet, you need to perform the following steps:

1. Connect the VCMI2 to the vehicle's DLC for both communication and power supply.
2. Connect the VCMI2 to the tablet via Bluetooth pairing, Wi-Fi, or USB connection.
3. When the above steps are completed, check the VCMI Manager Shortcut at the bottom of the screen. If a green BT, Wi-Fi, or USB icon displays at the lower-right corner, the MaxiSys tablet is ready to start vehicle diagnosis.

6.1.1 Vehicle Connection

The method used to connect the VCMI2 to a vehicle's DLC depends on the vehicle's configuration as follows:

- A vehicle equipped with an On-board Diagnostics Two (OBDII) management system supplies both communication and 12-volt power through a standardized J-1962 DLC.
- A vehicle not equipped with an OBDII management system supplies communication through a DLC connection, and in some cases supplies 12-volt power through the auxiliary power outlet adapter receptacle or a connection to the vehicle battery.

OBDII Vehicle Connection

This type of connection only requires the main cable without any additional adapter.

➢ **To connect to an OBDII vehicle**

1. Connect the main cable's female adapter to the Vehicle Data Connector on the VCMI2, and tighten the captive screws.
2. Connect the cable's 16-pin male adapter to the vehicle's DLC, which is generally located under the vehicle dashboard.

The vehicle's DLC is not always located under the dashboard. Refer to the user manual of the test vehicle for additional connection information.

Non-OBDII Vehicle Connection

This type of connection requires both the main cable and a required OBDI adapter for the specific vehicle being serviced.

There are three possible conditions for non-OBDII vehicle connection:

● DLC connection supplies both communication and power.

● DLC connection supplies communication, and power is to be supplied via the auxiliary power outlet adapter connection.

● DLC connection supplies communication, and power is to be supplied via connection to the vehicle battery.

➢ **To connect to a non-OBDII vehicle**

1. Connect the main cable's female adapter to the Vehicle Data Connector on the VCMI2, and tighten the captive screws.

2. Locate the required OBDI adapter and connect its 16-pin jack to the main cable's male adapter.

3. Connect the attached OBDI adapter to the vehicle's DLC.

◯ **NOTE**
Some vehicles may have more than one adapter or may have test leads instead of an adapter. Make the proper connection to the vehicle's DLC as required.

➢ **To connect the auxiliary power outlet adapter**

1. Plug the DC power connector of the auxiliary power outlet adapter into the DC power supply input port on the device.

2. Connect the male connector of the auxiliary power outlet adapter into the vehicle's auxiliary power outlet adapter receptacle.

➢ **To connect the clamp cable**

1. Connect the tubular plug of the clamp cable to the male connector of the auxiliary power outlet adapter.
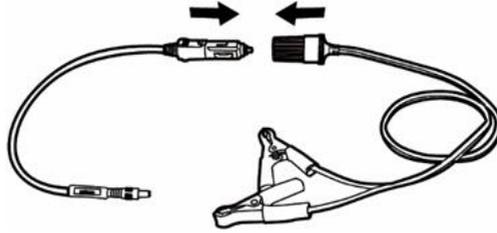

Figure 6-1 *Connection Between Auxiliary Power Outlet Adapter and Clamp Cable*

2. Plug the DC power connector of the auxiliary power outlet adapter into the DC power supply input port of the VCMI2.

3. Connect the clamp cable to the vehicle's battery.

6.1.2 VCMI Connection

After the VCMI2 is properly connected to the vehicle, the Power LED on the VCMI2 lights solid green and a beep sound will be heard, indicating it is ready to establish communication with the tablet.

Coming with the MaxiSys tablet tool kit, the VCMI2 supports three communication methods with the tablet: Bluetooth, Wi-Fi, and USB cable.

6.1.2.1 Bluetooth Connection

In open areas, the working range for Bluetooth communication is about 328 feet (100 m), giving technicians greater mobility to perform vehicle diagnosis from anywhere in the repair shop.

To expedite multi-vehicle diagnostics, more than one VCMI2 can be used in busy repair shops, enabling technicians to quickly pair their MaxiSys tablet to each VCMI2 via Bluetooth separately, therefore eliminating the need to unplug the VCMI2 from one vehicle and then connect it to another each time.

➢ **To pair the tablet with the VCMI2 via Bluetooth**

1. Power up the tablet.
2. Select the **VCMI Manager** application from the MaxiSys Job Menu.
3. Select **VCMI BT** from the connection mode list and tap the Bluetooth toggle to turn it **ON**. The device automatically scans for available devices for Bluetooth pairing. The found devices are listed in the settings section on the bottom-right of the screen.

✐ NOTE

If no VCMI2 is found, this may indicate that the signal strength is too weak to be detected. Reposition the VCMI2 and remove all possible objects that may cause signal interference. Tap the **Scan** button at the top-right corner of the screen to rescan for devices.

4. Typically, the VCMI2 name displays as "Maxi" suffixed with a serial number. Select the VCMI2 for pairing. (If more than one VCMI2 is used, ensure the correct VCMI2 is selected to pair.)

5. When the pairing is successful, the connection status displays as "Connected."

6. The VCMI Manager Shortcut on the bottom of the screen displays a green circle BT icon when the tablet and the VCMI2 are connected.

Refer to *VCMI Bluetooth Pairing* for additional information.

6.1.2.2   Wi-Fi Connection

The VCMI2 supports 5 GHz Wi-Fi connection. In open areas, the working range of 5G Wi-Fi communication is up to 328 feet (100 m).

➢ **To pair the tablet with the VCMI2 via Wi-Fi**

1. Power up the tablet.

2. Select the **VCMI Manager** application from the MaxiSys Job Menu.

3. Select **Wi-Fi** from the connection mode list and tap the Wi-Fi toggle to turn it **ON**. The tablet automatically scans for available devices for Wi-Fi connection. Found VCMI2 are listed in the settings section on the bottom-right of the screen.

4. Typically, the VCMI2 name displays as "Maxi" suffixed with a serial number. Select the required device for connection.

5. When the pairing is successful, the connection status is shown as "Connected."

6. The VCMI Manager Shortcut on the bottom of the screen displays a green circle Wi-Fi icon when the tablet and the VCMI2 are connected.

Refer to *Wi-Fi Connection* for additional information.

6.1.2.3   USB Cable Connection

The USB cable connection is a simple and quick way to establish a communication between the tablet and the VCMI2. After properly connecting the USB cable from the tablet to the VCMI2, the VCMI Manager Shortcut on the bottom of the screen displays a green badge and the Vehicle LED on the VCMI2 lights solid green, indicating the connection between the devices is successful. The MaxiSys diagnostics tablet is now ready to perform vehicle diagnosis.

NOTE

For the most stable communication, it is recommended to use a USB connection between the tablet and the VCMI2 when performing ECU programming or coding.

6.1.3 No Communication Message

A. If the tablet is unable to connect to the VCMI2, an "Error" message displays. An "Error" message indicates the tablet is not communicating with the VCMI2. Troubleshoot the error by performing the following steps:

- Ensure the VCMI2 is powered on.
- When using the wireless connection, ensure the network is configured correctly and the proper device has been connected.
- If the tablet loses communication abruptly during the diagnosis, ensure no objects are causing signal interruption.
- Ensure the VCMI2 is properly positioned with the VCMI2 front side up.
- Move the tablet closer to the VCMI2. If using the wired connection, ensure the cable is securely attached to the VCMI.
- Ensure the VCMI2 communication mode is lit for the selected communication type: Bluetooth, Wi-Fi, or USB cable.

B. If the VCMI2 is unable to establish a communication link, a message will display troubleshooting instructions. Possible causes for the communication error include:

- The VCMI2 is unable to establish a communication link with the vehicle.
- A vehicle system has been selected for diagnosis that is not supported by the vehicle.
- There is a loose connection.
- There is a blown vehicle fuse.
- The vehicle or the data cable has a wiring fault.
- There is a circuit fault in the data cable or adapter.
- The vehicle identification is incorrectly entered.

6.2 Getting Started

6.6.4 Active Test

The Active Test function is used to access vehicle-specific subsystem and component tests. Available tests vary by vehicle.

During an active test, the tablet sends commands to the ECU to activate the actuators. This test determines the integrity of the system or part by reading ECU data, or by monitoring the operation of the actuators. Such tests may include switching a solenoid, relay, or switch, between two operating states.

Selecting **Active Test** displays a menu of test options. Available tests vary by vehicle.
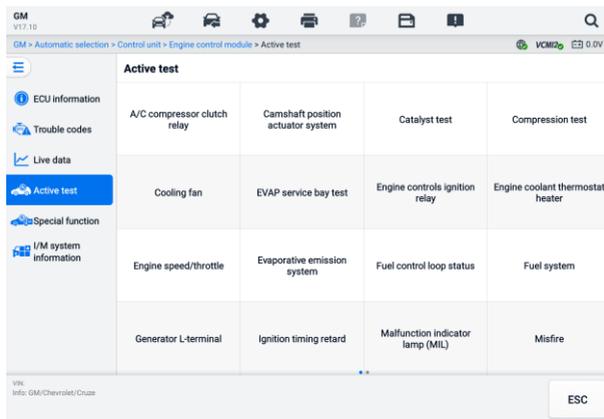

Figure 6-24 *Active Test Screen*

Select a test from menu options. Follow the instructions displayed on the screen to complete test. Procedures and instructions vary by vehicle.

The function buttons in the lower-right corner of the Active Test screen manipulate the test signals. The operational instructions are displayed in the main section of the test screen. Follow the on-screen instructions and make appropriate selections to complete the tests. Tap the **ESC** button to exit the test when finished.

6.6.5 Special Functions

Depending on the test vehicle, this selection may sometimes appear as Learning Process, Correction Programming, Emissions Inspection (Not valid for USA), OBD I/M Check (Not valid for USA), or something similar. You can select one to proceed according to your demands.

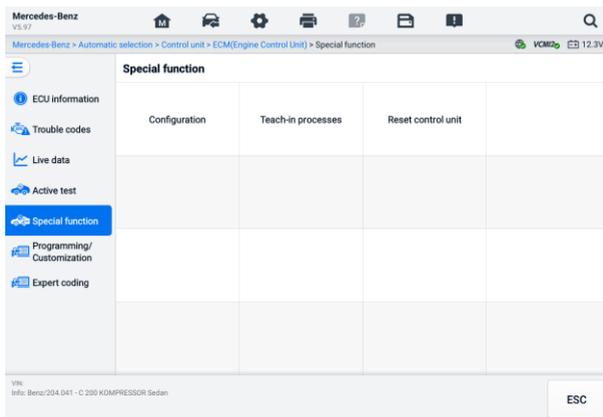

Figure 6-25 *Special Functions Screen*

6.7 Graphical Diagnostics

This function displays the vehicle system in a graphical format. It can intuitively show the relative position of the sensors in the system and the corresponding real-time data. The general diagnostic functions, including reading code, erasing code, and fault scanning, are also supported in this section. See *Diagnostics Functions* for details.

5. Follow the operations in the Live Data function to proceed. See *Live Data* for details.

6.9 Programming and Coding

Since the introduction of OBDII and leading up to modern hybrids and EVs, hardware and software technologies in cars have been advancing at an exponential rate. Updating software may be the only way to fix the following issues:

- Drivability
- Fuel Efficiency
- Power Loss
- Fault Codes
- Durability of Mechanical Parts

The Programming and Coding function is used to re-flash the vehicle control modules, which allows you to update the computer software of the vehicle to the latest version, as well as to reprogram adaptive data of certain components after making repairs or replacements.

⊘ **NOTE**
The programming function applies only when the vehicle is connected with a VCMI2, which serves as a PassThru interface to establish communication with and transfer data to the vehicle's ECU.

Available programming or coding operations vary by test vehicle. Only the available operations display in the tablet menu.

There are two general types of programming operations:

A. Coding — also known as Teach-in Program, or Component Adaptation, is used to reprogram adaptive data for vehicle control modules after repairs or replacements of vehicle parts.

B. Reprogramming — downloads the latest version of software from the online server database through Internet access (this procedure is done automatically when the tablet is connected to the Internet, so there is no need to check for software updates yourself), and reprograms the newest version into the vehicle's ECU.

⊘ **NOTE**

Ensure that the tablet is connected to a stable internet access before applying the ECU programming function, so that the tablet is able to obtain access to the vehicle manufacturer's server for update service.

Selecting the Programming opens a menu of operation options that vary by vehicle make and model. Selecting a menu option either displays a programming screen or opens another menu of additional choices. Follow the on-screen instructions to operate. How and what information is presented on the screen vary by the type of operation being performed.

6.9.1 Coding

The main section of the Coding screen displays a list of vehicle components and the coding information that mainly consists of two parts:

1. All available systems for coding are displayed on the left side, and the coding data or value on the right side.

2. The bottom of the main section displays the functional buttons that enable you to manipulate the operation.

Check the vehicle condition and the coding information carefully. Use the functional button to edit Codes for the corresponding components. Tap **Send** when you finish editing all items. When the operation is completed, an execution status message such as Completed, Finished or Successful, may display.

Tap the **ESC** button to exit the function.

6.9.2 Reprogramming

Before reprogramming begins:

- It is mandatory that the tablet is connected to a stable Wi-Fi network.

- The tablet must be connected to the VCMI2 via a USB cable.

- The tablet battery must be fully charged during module programming. Connect the tablet to a charger if needed.

- Attach the battery maintainer to the vehicle battery to ensure a steady voltage is maintained throughout programming. Voltage requirements differ by vehicle manufacturer. Consult vehicle manufacturer recommendations prior to programming a module.

- Do not quit the application during a module reprogramming as the process may fail and may also result in permanent damage to the module.

Typical reprogramming operations require you to input and validate VIN number first. Tap the input box and enter the correct number. The programming interface then displays.

The main section of the reprogramming interface offers information of the hardware, the current software version, and the newest software versions to be programmed into the control units.

A series of on-screen operational instructions will display to guide you through the programming procedure.

Carefully read the on-screen information and follow the instructions to execute the programming procedure.

6.9.3 Re-flash Errors

❗ IMPORTANT

When reprogramming onboard, always make sure the vehicle battery is fully charged and in good working condition. During reprogramming, the operation may fail if voltage falls below the proper operation voltage. Sometimes a failed operation can be recovered, but the failed reprogramming can also ruin the control module. We recommend connecting an external battery maintainer to the vehicle to ensure a steady voltage is maintained throughout programming. The required voltage differs by vehicle manufacturer. Consult vehicle manufacturer for correct voltage to be maintained.

Occasionally a flash update procedure may not complete properly. Common causes of flash errors include poor cable connections between the tablet, VCMI, and vehicle, the vehicle ignition being switched off before the flash procedure is complete, or low vehicle battery voltage.

If the process quits, recheck all the cable connections to assure good communications and initialize the flash procedure. The programming procedure will automatically repeat if the previous operation does not succeed.

6.10 Generic OBDII Operations

The OBDII/EOBD vehicle diagnosis option offers a quick way to check for DTCs, isolate the cause of an illuminated malfunction indicator lamp (MIL), check monitor status prior to emissions certification testing, and perform other emissions-related services. The OBDII direct access option is also used for testing OBDII/EOBD compliant vehicles that are not included in the database. Diagnostics Toolbar Buttons at the top of the screen are available for specific vehicle diagnostics. See *Table 6-2 Diagnostics Toolbar Buttons* for details.

6.10.1 General Procedure

➢ **To access the OBDII/EOBD diagnostics functions**

1. Tap the **Diagnostics** button from the MaxiSys Job Menu. The Vehicle Menu displays.

2. Tap the **EOBD** button. There are two options to establish communication with the vehicle.

   ● Auto Scan — select it to establish communication using each protocol in order to determine which one the vehicle is using.

   ● Protocol — select it to open a submenu of various protocols. A communication protocol is a standardized way of data communication between an ECM and a diagnostic tool. Global OBD may use several different communication protocols.

3. Select a specific protocol if the **Protocol** option is selected. Wait for the OBDII/EOBD Diagnostic Menu to appear.
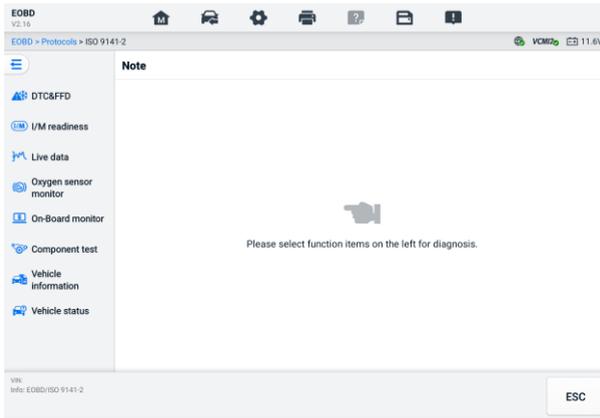

Figure 6-29 *OBDII Diagnostic Menu*

4. Select a function option to continue.

- DTC & FFD
- I/M Readiness
- Live Data
- Oxygen Sensor Monitor
- On-Board Monitor
- Component Test
- Vehicle Information
- Vehicle Status

⊘ NOTE

The supported functions may vary by vehicle.

6.10.2 Function Descriptions

This section describes the various functions of each diagnostic option:

6.10.2.1 DTC & FFD

When this function is selected, the screen displays a list of Stored Codes and Pending Codes. When the Freeze Frame data of certain DTCs are available for viewing, a snowflake button will display on the right side of the DTC item. The Erase Codes and Read codes functions can be applied by tapping the Function Buttons at the bottom of the screen.

- **Current Codes**

  Current codes are emission-related DTCs from the ECM of the vehicle. OBD II/EOBD Codes have a priority according to their emission severity, with higher-priority codes overwriting lower-priority ones. The priority of the code determines the illumination of the Malfunction Indicator Lamp (MIL) and the codes erase procedure. Manufacturers rank codes differently, so DTCs may vary by vehicle.

- **Pending Codes**

  These are codes whose storing conditions have been met during the last drive cycle, but need to be met on two or more consecutive drive cycles before the DTC stored. The purpose of displaying pending codes is to assist the service technician after a vehicle repair when diagnostic information is cleared, by reporting test results after a single driving cycle.

  a) If a test fails during the driving cycle, the DTC associated is reported. If the pending fault does not occur again within 40 to 80 warm-up cycles, the fault is automatically cleared from memory.

  b) Test results reported do not necessarily indicate a faulty component or system. If test results indicate another failure after additional driving, a DTC is stored to indicate a faulty component or system.

- **Freeze Frame**

  In most cases the stored frame is the last DTC reported. Certain DTCs, those that have a greater impact on vehicle emission, have a higher priority. In these cases, DTC of the highest priority is the one for which the freeze frame records are retained. Freeze frame data includes a "snapshot" of critical parameter values at the time the DTC is stored.

- **Erase Codes**

  This option is used to clear all emission-related diagnostic data including DTCs, freeze frame data and specific manufacturer-enhanced data from the vehicle ECM. This option resets the I/M Readiness Monitor Status for all vehicle monitors to Not Ready or Not Complete status.

  A confirmation screen displays when the clear codes option is selected to prevent accidental loss of data. Select **Yes** on the confirmation screen to continue, or select **No** to exit.

6.10.2.2 I/M Readiness

This function is used to check the readiness of the monitoring system. It is an excellent function to use prior to having a vehicle inspected for state emissions compliance.

Selecting I/M Readiness opens a submenu with two choices:

- Since DTCs Cleared — displays the status of monitors since the last time the DTCs are erased.

- This Driving Cycle — displays the status of monitors since the beginning of the current drive cycle.

6.10.2.3 Live Data

This function enables the display of real-time PID data from the ECU. Displayed data includes analog and digital input and output, and system status information broadcast in the vehicle data stream.

Live data can be displayed in various modes, see *Live Data* for detailed information.

6.10.2.4 Oxygen Sensor Monitor

This function allows retrieval and review of recent oxygen sensor monitor test results stored on the vehicle's on-board computer.

The Oxygen Sensor Monitor test function is not supported by vehicles that communicate using a controller area network (CAN). For Oxygen Sensor Monitor test results of CAN-equipped vehicles, refer to *On-Board Monitor*.

6.10.2.5 On-Board Monitor

This function allows you to view the results of On-Board Monitor tests. The tests are useful after the service when a vehicle's control module memory is already erased.

6.10.2.6 Component Test

This function enables dual-directional control of the ECM so that the diagnostic tool can transmit control commands to operate the vehicle systems. This function is useful in determining how well the ECM responds to a command.

6.10.2.7 Vehicle Information

This function enables the display of the vehicle identification number (VIN), calibration identification number, calibration verification number (CVN), and other information of the test vehicle.

6.10.2.8 Vehicle Status

This function checks the current condition of the vehicle, such as the communication protocols of OBDII modules, number of fault codes, and status of the Malfunction Indicator Light (MIL).

6.11 Diagnostic Report

6.11.1 Pre-Scan and Post-Scan Functions

After performing pre-scan and post-scan functions by entering the same maintenance order number, tap **Data Manager** > **Vehicle History** to select the historical test record named with the maintenance order number. Both the pre-scan results and post-scan results will be displayed in the same historical test record, which can be generated as a PDF report for easily comparing the changes between pre-scan and post-scan.

● **Pre-Scan Function**

Select and tap a vehicle button from the Vehicle Menu screen. Enter the maintenance order number in the pop-up box to scan and detect the whole vehicle. You can also add pictures to record the current condition of the vehicle. Once the pre-scan is completed, you are not allowed to perform the pre-scan again, and the scan result cannot be modified.

● **Post-Scan Function**

After the pre-scan is complete, exit the current test vehicle and tap the vehicle button from the Vehicle Menu screen to reconnect again. Enter the same maintenance order number in the pop-up box. The screen for post-scan will display. The post-scan record will be generated when the scan is completed. The pre-scan results and post-scan results will be displayed in the same historical test record.

⊘ **NOTE**

The post-scan function can be performed repeatedly. After exiting the vehicle, you only need to tap the vehicle button from the Vehicle Menu screen to reconnect again, and then enter the same maintenance order number in the pop-up box and follow the steps to rescan. The last one is the final post-scan result.

6.11.2 Diagnostics Report Saving, Viewing, and Sharing

---

2) Tap the 🔗 on the lower-right corner of the report.

3) There are three ways for report cloud sharing: scan the QR code, send by email, send by SMS (via phone number).

6.12 Exit Diagnostics

The Diagnostics application operates while communication with the vehicle is still active. It is important to properly exit from the diagnostics operation screen to stop all communications with the vehicle before closing the Diagnostics application.

📝 **NOTE**

Damage to the vehicle electronic control module (ECM) may occur if communication is disrupted. Ensure all forms of communication link such as data cable, USB cable, and wireless or wired network, are properly connected throughout the test. Exit all screens before disconnecting the test cable and power supply.

➢ **To exit the Diagnostics application**
   1. On an active diagnostics screen:
       1. Tap the **Back** or **ESC** button to exit a diagnostic session step by step.
       2. Or tap the **Vehicle Swap** button in the Diagnostics Toolbar to return to the Vehicle Menu screen.
   2. On the vehicle menu screen:
       1) Tap the **Home** button on the Top Toolbar.
       2) Or tap the **Back** button on the Navigation Bar at the bottom of the screen.
       3) Or tap the **Home** button on the Diagnostics Toolbar to exit the application directly and return to the MaxiSys Job Menu.

⊘ NOTE

After exiting the Diagnostics application, the tablet is no longer communicating with the vehicle and it is safe to open other MaxiSys applications.

7 Service

The Service section is specially designed to provide quick access to the vehicle systems for various scheduled service and maintenance tasks. The typical service operation screen is a series of menu-driven executive commands. Follow on-screen instructions to select appropriate execution options, enter correct values or data, and perform necessary actions. The application will display detailed instructions to complete selected service operations.

After entering each special function, the screen will display two application choices: Diagnosis and Hot Functions. The Diagnosis enables the reading and clearing of codes which is sometimes necessary after completing certain special functions. Hot Functions consists of sub-functions of the selected special function.
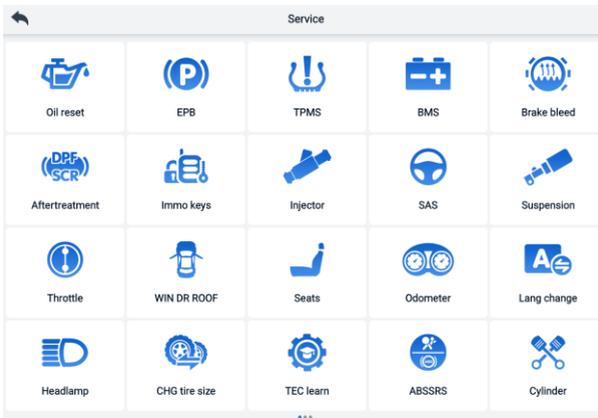

Figure 7-1 *Service Menu*

Several most commonly used services are described in this chapter.

7.1 Oil Reset Service

Perform reset for the Engine Oil Life system, which calculates an optimal oil life change interval depending on the vehicle driving conditions and climate. The Oil Life Reminder must be reset each time the oil is changed, so the system can calculate when the next oil change is required.

1. Always reset the engine oil life to 100% after every oil change.
2. All required work must be carried out before the service indicators are reset. Failure to do so may result in incorrect service values and cause DTCs to be stored by the relevant control module.
3. For some vehicles, the scan tool can reset additional service lights such as maintenance cycle and service interval. On BMW vehicles for example, service resets include engine oil, spark plugs, front/rear brakes, coolant, particle filter, brake fluid, micro filter, vehicle inspection, exhaust emission inspection and vehicle checks.

7.2 Electric Parking Brake (EPB) Service

This function has a multitude of usages to maintain the electronic braking system safely and effectively. The applications include deactivating and activating the brake control system, assisting with brake fluid control, opening and closing brake pads, and setting brakes after disc or pad replacement.

7.2.1 EPB Safety

It can be dangerous to perform Electric Parking Brake (EPB) system maintenance, so before you begin the service work, please keep these rules in mind.

✓ Ensure that you are fully familiar with the braking system and its operation before commencing any work.

✓ The EPB control system may be required to be deactivated before carrying out any maintenance/diagnostic work on the brake system. This can be done from the tool menu.

✓ Only perform maintenance work when the vehicle is stationary and on level ground.

✓ Ensure that the EPB control system is reactivated after the maintenance work has been completed.

✎ **NOTE**
Autel accepts no responsibility for any accident or injury arising from the maintenance of the Electric Parking Brake system.

7.3 Tire Pressure Monitoring System (TPMS) Service

This function allows you to quickly look up the tire sensor IDs from the vehicle ECU, as well as to perform TPMS replacement and reset procedures after tire sensors are replaced.

7.4 Battery Management System (BMS) Service

The Battery Management System (BMS) allows the tool to evaluate the battery charge state, monitor the close-circuit current, register the battery replacement, activate the rest state of the vehicle, and charge the battery via the diagnostic socket.

✐ **NOTE**
1. This function is not supported by all vehicles.
2. The sub functions and actual test screens of the BMS may vary by vehicle, please follow the on-screen instructions to make correct option selection.

The vehicle may use either a sealed lead-acid battery or an Absorbed Glass Mat (AGM) battery. Lead acid battery contains liquid sulphuric acid and can spill when overturned. AGM battery (known as VRLA battery, valve regulated lead acid) also contains sulphuric acid, but the acid is contained in glass mats between terminal plates.

It is recommended that the replacement aftermarket battery has the same specifications, such as capacity and type, as the exiting battery. If the original battery is replaced with a different type of battery (e.g. a lead-acid battery is replaced with an AGM battery) or a battery with a different capacity (mAh), the vehicle may require reprogramming of the new battery type, in addition to, performing the battery reset. Consult the vehicle manual for additional vehicle-specific information.

7.5 Diesel Particulate Filter (DPF) Service

The Diesel Particulate Filter (DPF) function manages DPF regeneration, DPF component replacement teach-in and DPF teach-in after replacing the engine control unit.

The ECM monitors driving style and selects a suitable time to employ regeneration. Vehicles driven a lot at idle speed and low load will attempt to regenerate earlier than those driven with higher load and speed. For regeneration to take place, a prolonged high exhaust temperature must be obtained.

In the event of the car being driven in such a way that regeneration is not possible, i.e., frequent short journeys, a diagnostic trouble code will eventually be registered in addition to the DPF light and "Check Engine" indicators displaying. A service regeneration can be requested in the workshop using the diagnostic tool.

Before performing a forced DPF regeneration using the tool, check the following items:

- The fuel light is not on.
- No DPF-relevant faults are stored in system.
- The vehicle has the specified engine oil.
- The oil for diesel is not contaminated.

❗**IMPORTANT**

Before diagnosing the problematic vehicle and attempting to perform an emergency regeneration, it is important to obtain a full diagnostic log and read out relevant measured value blocks.

✐**NOTE**
1. The DPF will not regenerate if the engine management light is on, or there is a faulty EGR valve.
2. The ECU must be re-adapted when replacing the DPF and when topping up the fuel additive Eolys.
3. If the vehicle needs to be driven in order to perform a DPF service, a second person is needed for the function. One person should drive the vehicle while the other person observes the screen on the Tool. Do not attempt to drive and observe the scan tool at the same time. This is dangerous and puts your life and the lives of other motors and pedestrians at risk.

7.6 Steering Angle Sensor (SAS) Service

SAS Calibration permanently stores the current steering wheel position as the straight-ahead position in the SAS EEPROM. Therefore, the front wheels and the steering wheel must be set exactly to the straight-ahead position before calibration. In addition, the VIN is also read from the instrument cluster and stored permanently in the SAS EEPROM. On successful completion of calibration, the SAS fault memory is automatically cleared.

Calibration must always be carried out after the following operations:

- Steering wheel replacement
- SAS replacement
- Any maintenance that involves opening the connector hub from the SAS to the column
- Any maintenance or repair work on the steering linkage, steering gear or other related mechanism

- Wheel alignment or wheel track adjustment
- Accident repairs where damage to the SAS or assembly, or any part of the steering system may have occurred.

⊘ NOTE

1. Autel accepts no responsibility for any accident or injury arising from servicing the SAS system. When interpreting DTCs retrieved from the vehicle, always follow the manufacturer's recommendation for repair.
2. All software screens shown in this manual are examples, and actual test screens may vary by test vehicle. Pay attention to the menu titles and onscreen instructions to make correct option selections.
3. Before starting procedure, make sure the vehicle has an ESC button. Look for button on dash.

8 ADAS

Advanced Driver Assistance Systems (ADAS) are an array of vehicle systems that aid the driver either through passive alerts or by active control of the vehicle to drive safer and with greater awareness and precision.

Cameras, sensors, ultrasound, radar and LIDAR are some of the systems used to capture the driving environment data, including travelling or static vehicles position, pedestrian location, road sign, driving lane and intersection detection, road (curves) and driving conditions (poor visibility or evening driving), use that information to instruct the vehicle to take its predetermined action. Cameras, sensors, and sensing systems are typically located in front and rear bumpers, windshield, front grill, and side and rearview mirrors.

Autel ADAS Calibration Tool provides comprehensive and precise ADAS calibration.

1. Covers many vehicle manufacturers, including Benz, BMW, Audi, Volkswagen, Porsche, Infiniti, Lexus, GM, Ford, Volvo, Toyota, Nissan, Honda, Hyundai, Kia, etc.
2. Supports the calibration of multiple driver assistant systems, including Adaptive. Cruise Control (ACC), Night Vision System (NVS), Lane Departure Warning (LDW), Blind Spot Detection (BSD), Around View Monitoring (AVM), Rear Collision Warning (RCW), Heads-up Displays (HUD), etc.
3. Supplies graphic illustrations and step-by-step instructions.
4. Provides demos to guide the technician through the calibration.

9   **Measurement**

The Measurement application can provide all the features needed for performing electrical and electronic circuit tests as well as monitoring signal activities on today's vehicles.

After properly connecting with a test vehicle and communicating with MaxiSys tablet, the VCMI2 (Vehicle Communication and Measurement Interface 2) is used as an integrated device that functions as an oscilloscope, a waveform generator, a multimeter, and a CAN bus inspection.

9.1 Oscilloscope

An oscilloscope is a measuring instrument that shows how a signal varies with time in a graphical way. Various signal activities can be displayed and monitored on a two-dimensional grid. The graphical form created by a signal is called a waveform. The voltage-time characteristic of the signal or waveform is drawn as a visual line called the trace.

9.1.1 Safety Information

Follow these instructions below to reduce the risk of injury from electric shock and prevent equipment damage.

A. Maximum input ranges

  Observe all terminal ratings and warnings marked on the product.

⚠ **DANGER**
- To prevent electric shock, take all necessary safety precautions when working on equipment where voltages beyond the specified input range may exists. Contact with voltages outside of the specified measuring range presents a risk of electric shock.
- To prevent injury or death, the oscilloscope must not be directly connected to the battery. To measure battery voltages, use a differential isolating probe specifically rated for battery use.

⚠ **WARNING**
Operation outside of the safe input range is likely to cause permanent damage to the oscilloscope and other connected equipment.

B. Grounding

⚠️ **DANGER**

- The scope's ground connection through the USB cable is for measurement purposes only. The oscilloscope does not have a protective safety ground.
- Do not connect the ground input (chassis) to any electrical power source. To prevent personal injury or death, use a voltmeter to check that there is no significant AC or DC voltage between the oscilloscope ground and the point to which you intend to connect the ground input.

⚠️ **WARNING**

- Applying a voltage to the ground input is likely to cause permanent damage to the oscilloscope, the attached computer, and other equipment.
- To prevent measurement errors caused by poor grounding, always use the high-quality USB cable supplied with the oscilloscope or Wi-Fi connection.

C. External connections

⚠️ **DANGER**

To prevent injury or death, use only the power cord and adaptor supplied with the product.

D. Environment

⚠️ **DANGER**

To prevent injury or death, do not use the product in wet or damp conditions, or around explosive gas or vapor.

⚠️ **WARNING**

To prevent any damage, always use and store your oscilloscope in appropriate environment.

E. Product Maintenance

The product contains no user-repairable parts. Repair, servicing, and calibration require specialized test equipment and must be performed by Autel Tech Support or an approved service provider.

⚠️ **DANGER**

To prevent injury or death, do not use the product if it appears to be damaged in any way. Stop using the product when any abnormal operations occur.

⚠ WARNING

- Do not tamper with or disassemble the oscilloscope, connectors or accessories. Internal damage will affect performance.
- Do not block any of the instrument's air vents to avoid damage caused by overheating.
- When cleaning the oscilloscope, use wet soft cloth with mild detergent in water. Do not allow water to enter the oscilloscope casing.

- ◇ **CAN High/CAN Low**: Controller Area Network (CAN) is a serial protocol used in automotive to allow microcontrollers to communicate with each other. It typically uses differential signaling (with signals named CAN High and CAN Low) to increase noise immunity.

- ◇ **LIN**: Local Interconnect Network (LIN) is a serial protocol used in automotive electronics to allow microcontrollers to communicate with low-speed peripherals.

- ◇ **FlexRay**: It is an automotive network communications protocol for high-speed data.

- ◇ **RS232/UART**: Universal Asynchronous Receiver/Transmitter (UART) is the communication interface found in the serial or COM ports once commonly found on computers. Each channel of data is transmitted on a single wire pair using an electrical standard such as RS232.

- ◇ **I2S**: Inter-IC Sound (I2S) is a serial protocol used in digital audio devices for communications between circuits such as CD transports and audio DACs.

- ◇ **I2C**: Inter-Integrated Circuit (I2C) is a way to connect peripheral chips in consumer electronics products and is widely used in embedded systems.

- ◇ **USB (1.0/1.1)**: Universal Serial Bus (USB) is widely used in personal computers and tablets for communication.

- ◇ **CAN FD**: The CAN FD serial protocol is an extended version of the Controller Area Network (CAN), which allows electronic controllers to receive sensor messages and transmits control messages faster than traditional CAN communication.

● **Math Channel**

A math channel is a virtual channel generated by a mathematical function of the input channel. It can be displayed in an oscilloscope in the same way as an input signal, and like an input signal it has its own measure axis, scale and color.

The oscilloscope has a set of built-in math channels:

✓ **Turnover**: reverses the signal polarity to turn the waveform upside down on the screen

✓ **A+B:** channel A plus channel B

✓ **A-B**: channel A minus channel B

✓ **A*B:** multiply channel A by channel B

✓ **A/B**: channel A divided by channel B

● **Auto Scale**

Use the **Auto Scale** button to trigger the device to automatically analyze the signal of the opened channel, and automatically set the appropriate amplitude and time base range to display the signal correctly. In auto scale setting, the time base is only valid for periodic signals.

9.1.5.2   Main Section

Up to four traces, along with digital readouts of current signal values, signal status and triggering conditions, can be displayed simultaneously on the main view section screen.

Each trace has two control features, **X-axis** and **Y-axis**, which enable you to adjust the oscilloscope settings to suit the particular test measurement. If multiple traces are

displayed at the same time, the **Y-axis** for each trace is adjusted separately while the **X-axis** is the same for all traces.

✓ **Y-axis —** the voltage level is recorded on the vertical. It displays on the left side of the screen.

✓ **X-axis —** time is presented on the horizontal line. It is shown along the bottom of the screen.

● **Measurement Overrange Indicator**

When the amplitude exceeds the measurement input range, a **red overrange indicator** with the message "**overrange**" is displayed in the top left corner of the screen. Exceeding the common-mode input range may result in inaccurate measurements and can lead to severe signal distortion.

● **Channel Selection**

In the main view section, a channel has two conditions: selected and unselected. A channel must be selected in order for the waveform to be movement, to use the zoom-in or to add measurement rulers.

Tap the Zero Baseline marker or the Y-axis (the line thickens when selected). After

the channel is selected, the waveform can be zoomed. Tap the counterclockwise arrow button at the right corner to recover after zooming.

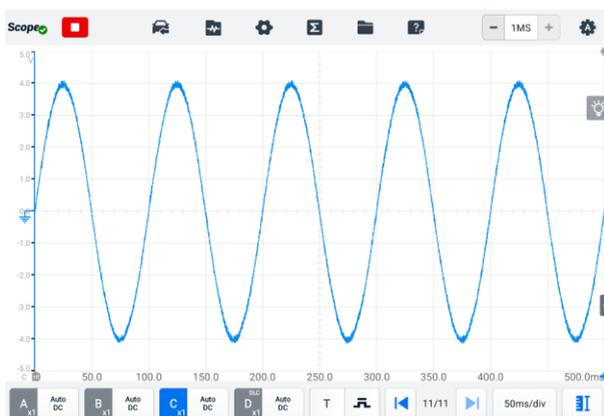

Figure 9-32 *Channel Selection 1 (Unselected)*

● **Waveform Zooming**

The zooming function allows you to change the size and position of a signal during or after capturing a waveform to examine it in greater details. It does not change the stored data, but the way it displays.

The X-axis and Y-axis can be zoomed using your fingertips. The waveform can be zoomed during or after capturing the signal.

● **Measurement Rulers**

The coordinate Rulers allow the amplitude and time duration of a waveform to be measured precisely. They are useful when determining signal characteristics such as amplitude at specific points, the cycle time (duration) and frequency.

There are three types of measurement rulers: the vertical **Time Ruler**, the horizontal **Signal Ruler**, and the vertical **Angle Ruler**.

Tap the **Ruler Activator** in the lower left corner of the grid and drag it across the screen to the desired position. A **Time Ruler** is generated.

Tap the **Ruler Activator** in the lower right corner of the grid and drag it across the screen to the desired position. An **Angle Ruler** is generated.

The two angle rulers are positioned to mark the start and end of a cycle. By default, the start and end angle values are 0° and 720°, which can be configured in the Phase Setting box.

The **Signal Ruler** can be generated in the similar way by tapping the **Ruler Activator** in the upper right corner and dragging it downwards.

When dragging the Measurement Rulers, a **Ruler Table** showing time and voltage values for the corresponding channels will be displayed. The **Delta** icon refers to the absolute difference between the values of the rulers, which can be locked by tapping the **Lock** icon. Tap the **X** button in the upper right corner of the ruler table to delete all rulers.

Table 9-6 *Channel Color Table*

Input Channel	Color
A	Red
B	Green
C	Blue
D	Yellow

✧ **Amplitude Setting**

The amplitude, probe, and low-pass filtering settings can be configured in the Channel control dialog box.

The amplitude setting allows you to set up the oscilloscope to capture signals with the specified range. If the input signal exceeds the selected range, an over-range indicator will be displayed. Select **Auto** to enable the device to adjust the

125

vertical scale automatically.

The vertical scale will be changed, while the horizontal scale will not be changed. AC and DC voltage can be toggled to set up the input circuitry.

✎ NOTE
The vertical scale is ALWAYS divided into 10 major divisions, and all scale settings reflect in these 10 divisions. The division set of 10 cannot be changed.

There are two modes available to set the amplitude value.

Mode 1: For example, selecting **DC 5 V** sets the channel amplitude to ±5 DC (displayed on the right side of the channel control button), the vertical scale range is from -5 V to +5 V. The vertical scale is divided into 10 segments, each segment increases by 1 V.

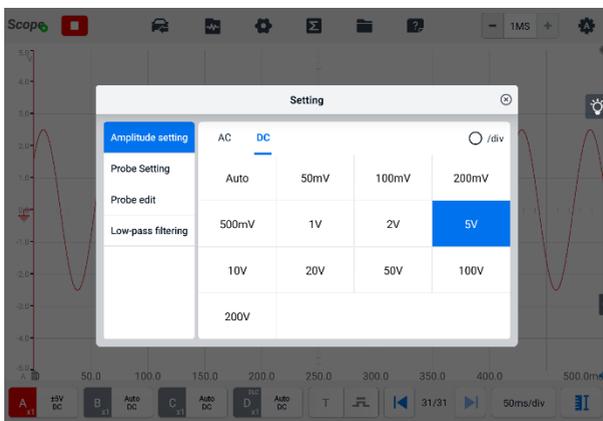

Figure 9-41 *Amplitude Setting Screen (DC 5 V)*

Mode 2: Select the **## /div** button to adjust value incremented by each division. For example, selecting **DC 1.0 V/div**, sets the channel amplitude to 1.0 V/div DC (seen at the right side of the channel control button). Each segment increases by 1 V. As the vertical scale is divided into 10 segments, the entire vertical scale range is from -5 V to +5 V.

◇ **Probe Setting**

A probe is an accessory that connects to your oscilloscope and to detect signals to be measured.

✧ **LPF (Low-pass Filtering)**

The Low-pass Filtering (LPF) is an independent digital low-pass filter for each input channel used to remove noise from the signal.

This function is used to filter the high frequency signal of the selected input channel for more accurate measurements. Take the two screenshots below as an example to show the comparison with or without setting the low-pass filtering. The following screenshots how the difference between waveforms with the low-pass filtering and waveforms without the low-pass filtering.

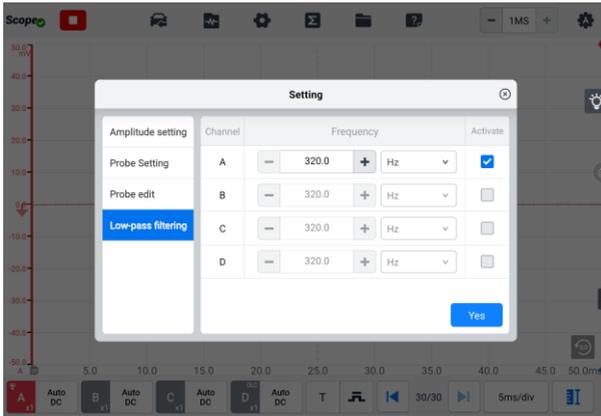

Figure 9-49 *Low-pass Filtering Screen*

4. Close the dialog box directly to exit without saving.

● **Trigger**

The trigger feature is used to filter and capture specified waveform data.

According to the trigger setting condition, the trigger waveform will be captured when the signal meets the trigger condition. When capturing waveforms, you can manually set the trigger conditions.

When the oscilloscope is capturing the signal, tap the left column of the **Trigger** button to activate the trigger function. A **trigger point** will be shown as a blue point.

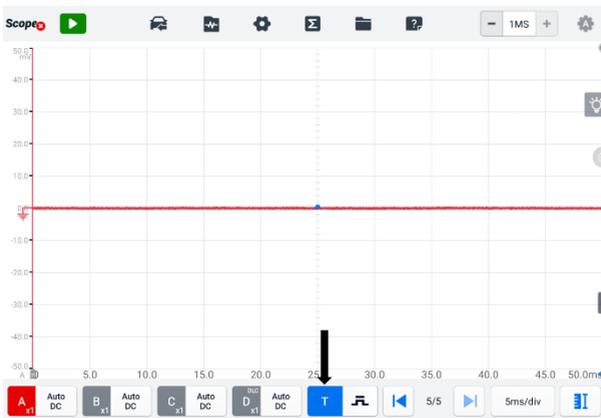

Figure 9-50 *Trigger Point Screen*

When the oscilloscope is capturing the signal, tap the ⚡ icon to open the trigger settings dialog box.

✧ **Edge Triggering**

The edge trigger is one of the most common trigger modes and is activated when voltage rises above or falls below a preset threshold. This trigger type allows you to configure the trigger mode, threshold, trigger channel and pulse direction settings. Tap **OK** to save the settings or tap **Cancel** to exit without saving.

⊘**NOTE**

The oscilloscope switches to the continuous mode if the time base is set to more than or equal to 200 ms/div. The Edge Triggering is supported in the continuous mode.

● **Trigger Mode**

Four trigger modes are available: **None, Auto, Repeat,** and **Single**.

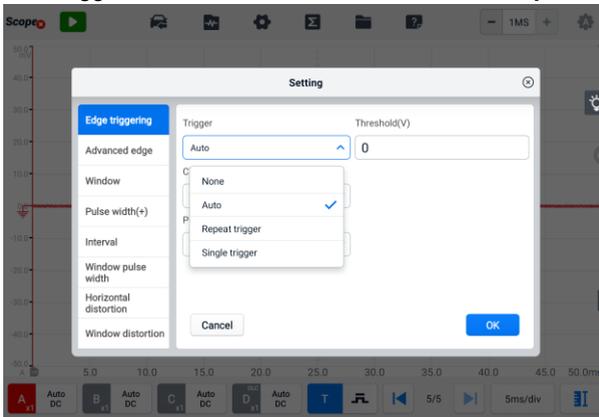

Figure 9-51 *Trigger Mode Screen*

The table below offers brief descriptions for each trigger mode.

Table 9-7 *Trigger Mode Table*

Trigger Mode	Description
None	In this trigger mode, the oscilloscope can continuously capture data, without waiting for a trigger event.

133

Trigger Mode	Description
Auto	In this trigger mode, the oscilloscope will wait for a trigger before capturing data. It can automatically update after a short period, even if the signal does not across the trigger point.
Repeat	In this trigger mode, the oscilloscope waits until a trigger event occurs. If there is no trigger event, nothing will be displayed on the screen.
Single	In this trigger mode, the oscilloscope stops capturing data once a trigger event occurs.

- ● **Channel**

  Select the applicable trigger channel from the dropdown menu. The selected channel is the one that the oscilloscope monitors for the trigger condition.

- ● **Pulse Direction**

  Two pulse direction settings are available: **Rise** and **Fall**.

  Rise Edge Trigger — indicates trigger is turned on to start the trace on the rising edge of the waveform.

  Fall Edge Trigger — indicates trigger is turned on to start the trace on the falling edge of the waveform

- ● **Threshold**

  The **Threshold** allows you to set the voltage threshold for the trigger.

  - ✓ To precisely position the trigger point, input the value in the Threshold field in the trigger settings dialog box.
  - ✓ To roughly position the trigger point, drag the trigger point to a desired position.

➢ **To configure the trigger settings**

1. Tap the right column of the **Trigger** button to open the trigger settings dialog box.
2. Select the trigger mode, trigger channel, and pulse direction in the dropdown list.
3. Input the value in the Threshold field in the trigger settings dialog box.
4. Tap **OK** to save settings or tap **Cancel** to exit without saving.

Advanced Edge

This trigger type includes all the functions of the edge trigger type, plus two additional options: **the Rising or Falling option** and **the hysteresis option**.

Rising or Falling option in the dropdown menu of the pulse direction: Dual edges of a waveform can be triggered. This mode is especially useful for monitoring pulses of both polarities at once.

Hysteresis option: It is used to reduce false triggering on noisy signals. When hysteresis is enabled, a second trigger threshold voltage is used in addition to the main trigger threshold. The trigger fires only when the signal crosses the two thresholds in the correct order. The first threshold arms the trigger, and the second causes it to fire.

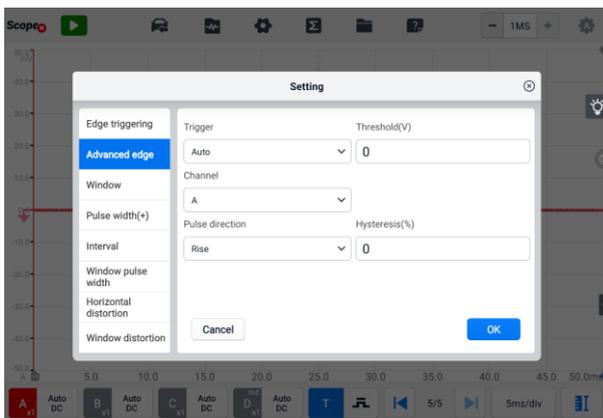

Figure 9-52 *Advanced Edge Settings Screen*

 Window

This trigger type is used to monitor when the signal enters or exits a specified voltage window.

Three options are available for the pulse direction: **Entering, Exiting, Entering or Exiting**. **Threshold 1** and **Threshold 2** are the upper and lower voltage limits of the window.
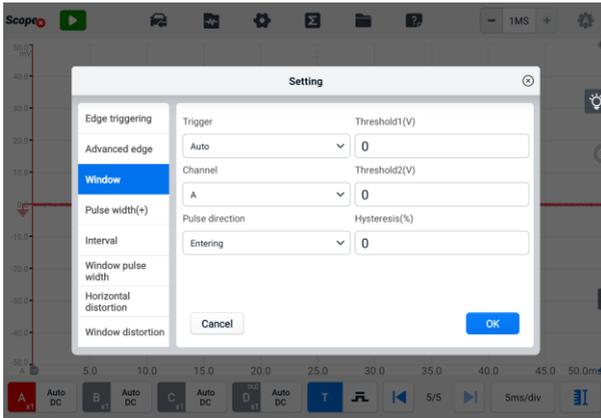

Figure 9-53 *Window Settings Screen*

✧ **Pulse Width (+)**

This trigger type allows you to monitor pulses of a specified width.

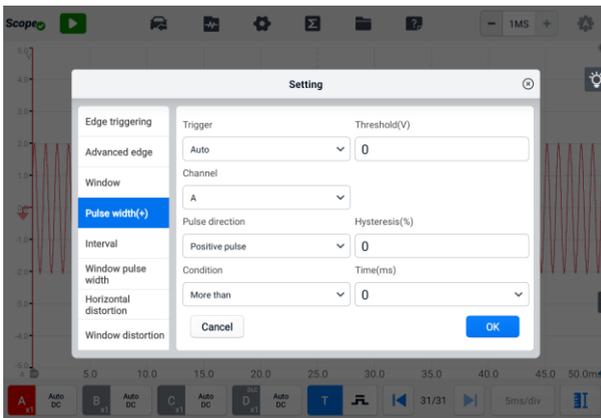

Figure 9-54 *Pulse Width Settings Screen*

➢ **To set the pulse width (+)**

1. Tap the **Trigger** button at the bottom of the screen to open the Trigger Settings dialog box.

2. Select the **Pulse Width (+)** in the left column of the dialog box.

3. Select the desired trigger mode and channel mode.

4. Set the pulse direction to either Positive pulse or Negative pulse according to

136

the polarity of the pulse.

5. Select one of the four Conditions:

- **More than**: triggers on pulses wider than the specified time.
- **Less than**: triggers on pulses narrower than the specified time.
- **In the time range**: triggers on pulses wider than Time 1 and narrower than Time 2.
- **Out of the time range**: triggers on pulses narrower than Time 1 or wider than Time 2.

6. Set the trigger **Threshold** and **Hysteresis**.

7. Set the **Time 1** or **Time 2** in minutes (if available) to define the pulse width.

8. Tap **OK** to save settings or tap **Cancel** to exit without saving.

◇ **Interval**

This trigger type allows you to search for two consecutive edges of the same polarity separated by a specified time interval.

For the setting operation, please refer to the operation steps of Pulse Width, but the pulse direction with Rise or Fall selection instead of Positive or Negative.

◇ **Window Pulse Width**

This trigger type combines with the window trigger and the pulse width trigger. It detects when a signal enters or exits an input range and stays for a specified period of time. Two **Region** options can be selected: **In range** and **Out of range**.

◇ **Horizontal Distortion**

This trigger type can be monitored when the signal goes high or low for longer than the specified time.

◇ **Window Distortion**

This trigger type monitors when a signal enters a specified voltage range and stays within that range for a specified period of time.

◇ **Underthrow**

This trigger type monitors a pulse that exceeds one threshold and then drops below the threshold without exceeding the second threshold. This type of trigger is typically used to find pulses that do not reach a valid logic level.

● **Buffer**

The buffer is used to store the captured waveform data for real-time and playback

display.

The oscilloscope can capture and store waveforms. Select a waveform from the waveform buffer by tapping the **Previous** or **Next** button.

The waveform buffer displays the current waveform number and the total number of stored waveforms.

Figure 9-55 *Buffer Screen*

Button	Name	Description
◄	**Previous**	Tap to display the previous waveform in the buffer.
32/32	**Buffer Index**	Displays the number of the waveform currently displayed onscreen out of the total number of buffered waveforms.
►I	**Next**	Tap to display the next waveform in the buffer.

● **Time Base**

The Time Base controls the oscilloscope data sampling display time. Tap the **Time Base** button at the bottom to open the setting dialog box.

138
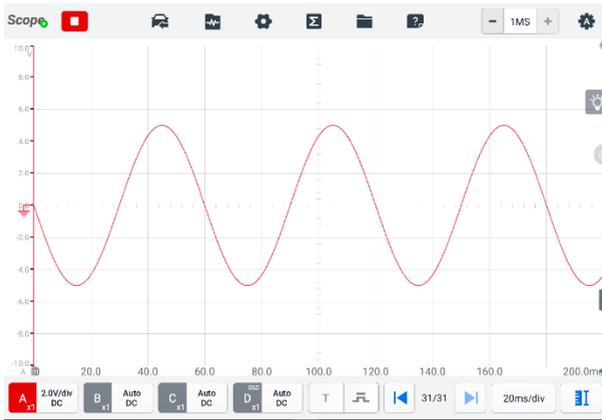

Figure 9-56 *Time Base Screen 1 (Normal Mode)*

Continuous Mode: if the time base is set to more than or equal to 200ms/div, the oscilloscope switches to the continuous mode. In this mode, the oscilloscope updates the trace continuously as each capture progresses, rather than waiting for a complete capture before updating the trace.

Figure 9-57 *Time Base Screen 2 (Continuous Mode)*

9.1.6 Troubleshooting

A. If the oscilloscope cannot communicate with the MaxiSys tablet:

● Ensure the VCMI2 is properly connected to the MaxiSys tablet via BT, Wi-Fi or with the supplied USB cable.

● Restart the MaxiSys tablet and reconnect the VCMI2 if communication between the two continues to fail.

B. If unwanted signals are displayed or signals are distorted:

● Use only the supplied test leads or probes to connect with the input channels.

● Check the test leads or probes for damage.

● Ensure the polarity of the test leads connections are correct.

● Ensure the signal and ground connections are clean and secure.

● Ensure the ground lead is providing a direct ground from the circuit to the input channel.

● Isolate the test leads from other components, leads, or systems that may induct unwanted noise into the signal being tested including the electric motors, secondary ignition components, relays, alternators.

9.1.7 Glossary

AC/DC Control

Each channel can be set to either AC coupling or DC coupling. With DC coupling, the voltage displayed onscreen is equal to the true voltage of the signal with respect to ground. With AC coupling, any DC component of the signal is filtered out, leaving only the variations in the signal for the AC component.

Aliasing

When the signal frequency gets higher than half the scope's maximum sampling rate and exceeds the limit, a distorted waveform displays. This distortion is called aliasing.

Amplitude

The maximum voltage generated from the zero volts line of the oscilloscope.

Analog Bandwidth

The frequency at which a displayed sine wave has half the power of the input sine wave (about 71% of the amplitude).

Buffer Size/Cache Size

The size of the oscilloscope's buffer memory. The buffer memory is used by the oscilloscope to temporarily store data. This helps to compensate for the differences in data transfer rate from one device to another.

Frequency

The number of signal occurrences per second. Frequency is measured in Hz (hertz).

Peak to peak voltage

The difference in voltage between the minimum and maximum voltages occurring in the waveform.

Figure 9-68 *Main Section Screen (Waveform Mode)*

The main section features a coordinate grid with the **X-axis** representing the time duration and the **Y-axis** representing the amplitude level. The amplitude level on the Y-axis can be configured in the Amplitude Settings.

A. Channel Selection

In the main section, a channel has two conditions: selected and unselected. A channel must be selected in order for the waveform to be movement, to use the zoom-in or to add measurement rulers.

➢ **To select and unselect the channel**

1. Tap the Zero Baseline marker or the Y-axis (the line thickens when selected).

The X-axis and Y-axis can be zoomed using your fingertips. The waveform can be zoomed during or after capturing the signal.

C. Measurement Rulers

In the coordinate grid, there are two kinds of **measurement rulers**, which allow the amplitude and time duration of a waveform to be measured precisely. They are useful when determining signal characteristics such as amplitude at specific points, the cycle time (duration) and frequency.

The vertical **Time Ruler** — tap the **Ruler Activator** in the bottom left corner of the grid and drag it across the screen to the desired position. A **Time Ruler** is generated.

The horizontal **Signal Ruler** — the **Signal Ruler** can be generated in the similar way by tapping the **Ruler Activator** in the upper right corner and dragging it downwards.

⊘ NOTE
The horizontal signal ruler varies according to the settings of the voltage, current, frequency, duty cycle, etc.

When dragging the Measurement Rulers, a **Ruler Table** showing time and amplitude values for the corresponding channels will be displayed. The **Delta** icon refers to the absolute difference between the values of the rulers, which can be locked by tapping the **Lock** icon. Tap the **X** button in the upper right

corner of the ruler table to delete all rulers.

There are two modes available to set the amplitude value.

Mode 1: For example, selecting **DC voltage** in Measurement setting screen sets the measurement type to DC voltage, selecting **10 V** in Amplitude setting screen sets the amplitude to Amplitude 10 V (displays on the lower left corner of the screen). The vertical scale range is from -10 V to +10 V. As the vertical scale is divided into 10 segments, each segment increases by 2 V.

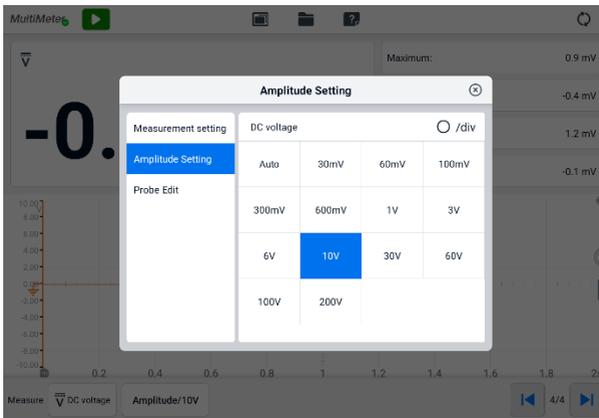

Figure 9-76 *Amplitude Setting Screen (DC 10 V)*

Mode 2: Select the **## /div** button to adjust the value increments of each division. For example, selecting **DC voltage** in Measurement setting screen, sets the measurement type to DC voltage. Selecting **2.0 V/div** in Amplitude setting screen, sets the amplitude to Amplitude 2.0 V/div (displays on the lower left corner of the screen). Each segment increases by 2 V. 9.3.6 Troubleshooting

If the waveform generator cannot communicate with the tablet:

- Check if the VCMI2 is properly connected to the tablet through the supplied USB cable.

- If the communication between the VCMI2 and the tablet still fails, restart the tablet and reconnect the VCMI2.

🛈 **IMPORTANT**

To avoid damaging the vehicle and the equipment, all vehicle communications must be terminated before resetting the connection. The Internet connection may be aborted during resetting.

9.4 Bus Inspection

Bus Inspection is an instrument that detects the communication status of CAN Bus. When the VCMI2 (Vehicle Communication and Measurement Interface 2) device is connected with the MaxiSys tablet, you can open the **Bus Inspection** application by taping the **Measurement** icon on the Home screen of the tablet and then tapping the **OBD** icon, and perform the OBD-related functions including the signal detection. The indicator light flashes if the signals are detected. The indicator light displays in gray if no signal is detected.

Generally, the vehicle's electronic control systems are designed to comply with the specific communication protocols. The control units in the electronic control systems communicate with the Tablet through the OBDII (DLC) adapter.

With the Bus Inspection function, you can check whether the control units in vehicle's electronic control systems work properly or not with the indicator light according to the condition of sending out the communication signals.

9.4.1 Safety Information

Follow the instructions below to ensure proper CAN Bus check performance.

- Different preconditions for different functions. Before checking, please read the inspection guides carefully.
- The pin number for OBDII varies by vehicle modes. Please check and confirm for correct pin number and then proceed inspection.
- Select OBDII connector's signal pins manually if the test vehicle's actual communication signal pins are assigned differently.
- Ensure the DLC main cable is connected to the vehicle before inspection.
- Ensure the ignition key is in ON position when testing the vehicle's communication line.
- If the inspection fails due to no signal input, consult vehicle circuit diagram to ensure correct communications are being tested.
- Do not use in wet or damp conditions, or around explosive gas or vapor.
- Do not tamper with or disassemble the product, connectors or accessories. Internal damage will affect performance.
- Disconnect the product from power source, vehicle and tablet before cleaning.
- When cleaning the product, use a damp, soft cloth with mild detergent. Do not allow water to enter the product casing, as this will cause damage to the electronics inside.

9.4.4.2   Main Section and Lower Toolbar

Two modes are available in the OBD communication line inspection function: Indicator Mode and Waveform Mode.

A.   Indicator Mode

This mode is designed to show the condition of voltage fluctuation in vehicle's communication lines. In this mode, the indicator light of a selected pin flashes when the electronic control units are sending signals properly.

The Indicator Mode displays by default.
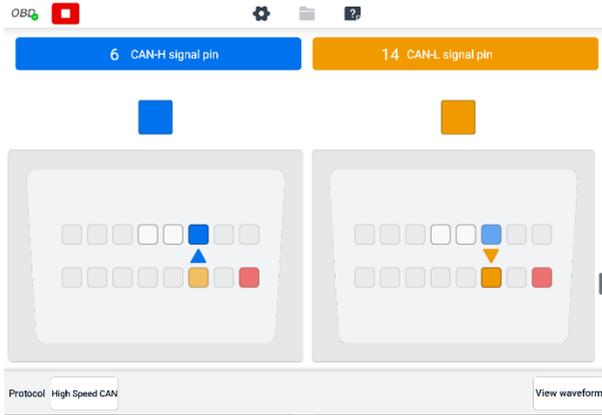

Figure 9-115 *Indicator Mode Screen*

Main Section

The **CAN-High** line is assigned to **Pin 6** and the **CAN-Low** line is assigned to **Pin 14** of the OBDII adapter by default according to the **CAN-Bus** standard protocol.

If the test vehicle's actual communication signal pins are assigned differently, you can select OBDII connector's signal pins manually in the Settings menu.

When the electronic control units send out signals properly, the left and right indicator lights will flash consecutively on the screen.

⌀ NOTE
The flashing indicator lights serve to confirm only that communication signals have been detected.

Lower Toolbar

- Protocol — in the left-lower corner of the screen, you can select the protocol you want to test.

Figure 9-116 *Protocol Button Screen*

The following protocols are included:

✧ **High Speed CAN** — offers baud rates from 40 Kbit/s to 1 Mbit/sec, depending on cable length. This is the most popular standard for the physical layer, since it allows for simple cable connection between devices. High speed CAN networks are terminated with 120 ohm resistors on each end of the network.
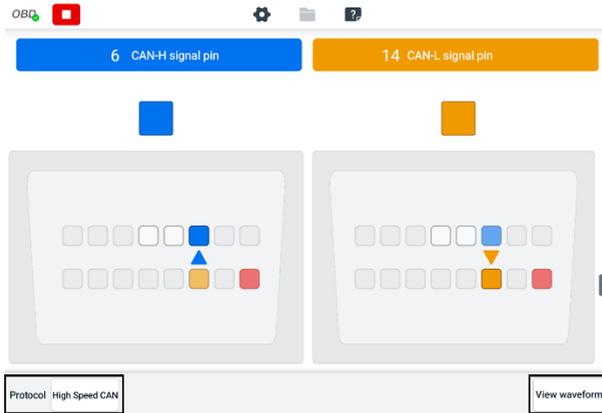

✧ **Low Speed CAN** — offers baud rates from 40 Kbit/s to 125 Kbits/sec. This standard allows CAN bus communication to continue in case of a wiring failure on the CAN bus lines. In low speed CAN networks, each device has its own termination.

✧ **Single CAN** — offers baud rates up to 33.3 Kbit/s (up to 88.3 Kbit/s for high-speed mode)

✧ **J1939 CAN** — is used in the commercial vehicle area for communication throughout the vehicle with the physical layer defined in ISO 11898. Under J1939/11 and J1939/15, the data rate is specified as 250 Kbit/s, with J1939/14 specifying 500 Kbit/s.

✧ **J1850 (PWM)** — SAE J1850 pulse-width modulation offers baud rates up to 41.6 Kbit/s, standard of the Ford Motor Company

✧ **J1850 (VPW)** — SAE J1850 variable pulse width offers baud rates up to 10.4 Kbit/s, standard of the General Motors

✧ **J1708 (SAE)** — the standard defines a double-wire 18-gauge cable that can run up to 130 feet (40 m) and operates at 9600 bit/s

● View Waveform — in the right-lower corner of the screen, you can enter to the Waveform Mode by tapping the **View Waveform** button.

Test Procedure

The test procedure is the same for all the protocols.

➢ **To test the communication line**

Using High speed CAN-bus line as an example.

1. Make sure the VCMI2 is connected to the vehicle's OBDII connector. The VCMI2 is connected with tablet successfully.

2. Place the ignition in the key ON position.

3. Tap the **Measurement** icon on the Job Menu of the MaxiSys tablet. The Measurement screen opens. Tap the **Bus Inspection** icon to open the Bus Inspection Menu. Select the **High Speed CAN** protocol in the lower corner of the screen.

4. Tap the **Start** button on the upper-left corner of the screen to start the device. The OBDII connector pin number that the signals are using is indicated, and the indicator light flashes if the signals are detected. Otherwise, the indicator light displays in gray.

⊘ **NOTE**

If the indicator light is not flashing, ensure the ignition is in the key ON position and that signal pin assignment is correct.

B. Waveform Mode

This mode allows you to view the test result in a waveform form. This mode offers greater details and offers a larger number of configuration options.

The screen is displayed in the Indicator Mode by default.

Tap the **View Waveform** button in the lower corner of the Indicator Mode screen to switch to the Waveform Mode. The screen is shown as below.
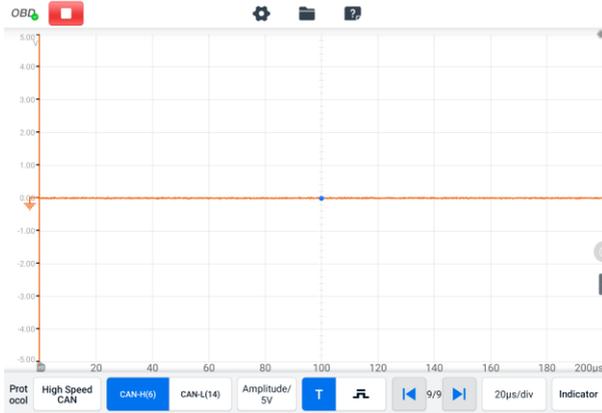

Figure 9-117 *Waveform Mode Screen*

Main Section

The main section features as a coordinate grid with **X-axis** and **Y-axis**, representing the time duration and amplitude level respectively. The amplitude level can be configured in the Amplitude Settings and the time duration can be set in the Time Base Settings.

◇ **Channel Selection**

Each channel has two conditions: selected and unselected. Some operations depend on the selected condition of the channel, such as measurement rulers, waveform movements, and waveform zooming.

➢ **To select and unselect the channel**

1. Tap the Zero Baseline marker or the Y-axis (the line thickens when selected).

2. Tap the Zero Baseline marker or the Y-axis again to exit the channel selection.

◇ **Waveform Zooming**

The zooming function allows you to change the size and position of a signal during or after capturing a waveform to examine. It does not change the stored data, only the way it displays.

The X-axis and Y-axis can be zoomed using your fingertips. The waveform can be zoomed during or after capturing the signal.

◇ **Measurement Rulers**

In the coordinate grid, there are two types of **measurement rulers**, which allow the amplitude and time duration of a waveform to be measured precisely. They are useful when determining signal characteristics such as amplitude at specific points, the cycle time (duration) and frequency.

The vertical **Time Ruler** — tap the **Ruler Activator** in the bottom left corner of the grid and drag it across the screen to the desired position. A **Time Ruler** is generated.

The horizontal **Signal Ruler** — the **Signal Ruler** can be generated in the similar way by clicking the **Ruler Activator** in the top right corner and dragging it downwards.

When dragging the Measurement Rulers, a **Ruler Table** showing time and voltage values for the corresponding channels will be displayed. The **Delta** icon refers to the absolute difference between the values of the rulers, which can be locked by tapping the **Lock** icon. Tap the **X** button in the upper right corner of the ruler table to delete all rulers.

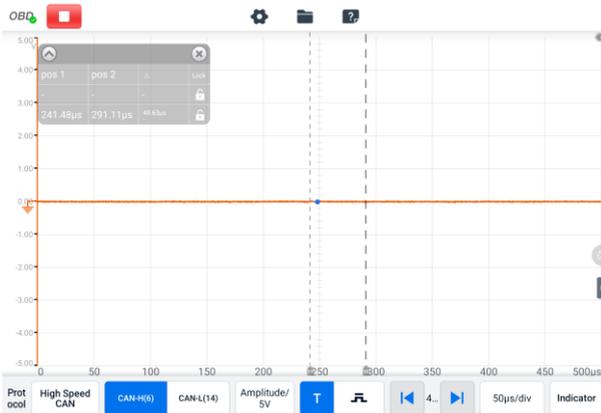

Figure 9-118 *Measurement Rulers Screen*

◇ **Zero Baseline**

The zero baseline is marked as the 0 value in the Y-axis, showing the base level of each channel waveform. After the channel is selected, the zero baseline can be adjusted by dragging the baseline marker up/down along the Y-axis, or dragging the waveform up/down or moving the screen up/down in the grid.

OBD-II diagnostic connector

The OBD-II DLC (post-1996 vehicles) is usually located under the instrument panel on the driver side, though there are several exceptions. The SAE J1962 specification provides for two standardized hardware interfaces, called type A and type B. Both are female, 9-pin (2x8), D-shaped connectors, and both have a groove between the two rows of pins.

DLC

The data link connector (DLC) is the multi-pin diagnostic connection port for automobiles, trucks, and motorcycles used to interface a scan tool with the control modules of a given vehicle and access on-board diagnostics and live data streams.

You can use the application to receive ad-hoc remote support from Autel's support center, colleagues, or friends, by allowing them to control your MaxiSys tablet on their PC via the TeamViewer software.

21.1 Operations

If you think of a TeamViewer connection as a phone call, the TeamViewer ID would be the phone number under which all TeamViewer Clients can be reached separately. Computers and mobile devices that run TeamViewer are identified by a globally unique ID. The first time the Remote Desktop application is started, this ID is generated automatically based on the hardware characteristics and will not change.

Make sure the tablet is connected to the Internet before launching the Remote Desktop application, so that the tablet is able to receive remote support from a third party.
